

ABSTRACT OF THE DISCLOSURE

A bottle support plate for use in a rotary capping machine used to apply caps onto the upper threaded neck of one or more containers having a non-fully circular flange. The containers are moved along a generally circular path by a star wheel. The bottle support plate is connected to the star wheel and includes a pocket that at least partially supports and at least partially mates with the flange of the container to at least partially inhibit rotation of the container during the threading of a cap on the upper threaded neck of the container.
